## Foreword

This project to develop a universal defense systems acquisition management taxonomy and apply the taxonomy to develop needed inventories of acquisition management documents is truly a continuing project. Major Morris initiated it as an ISP project in PMC 76-2. Major Tateyama continued it through PMC 77-1 and submitted his project report on 11 May to meet the PMC 77-1 report deadline. Since then, continuing project activities have provided new information and insights. These activities are cited here and their results are included in this report to make it as current and complete as possible, since it is the first report to be distributed widely for use and comment. Feedback aimed at further improvement of both the taxonomy and the inventory of official documents, and at using the improved taxonomy to develop other useful inventories, is needed now to continue the project initiated by Majors Morris and Tateyama.

After submitting his report in May, Major Tateyama continued to add new and updated data to the official documents inventory and to make other improvements in his report until his departure in late June for his new assignment.

The Administration Division of the College and the Library have begun a joint project to use the inventory to develop and maintain an official documents reference section in the DSMC Library. The Administration Division has established procedures to obtain automatic distribution of the following to DSMC: all official publications indexes used to develop the document-source inventories (Indexes E through P) in this report; all additional official publications indexes needed for the development of other document-source inventories as the scope of the official documents section in the Library is increased; and all documents listed in the document-source inventories, as well as all future revisions of these documents. The Inventory by Taxonomy Subject, Index D, will be a library aid in the new official documents reference section, where it can be used to locate all documents that have been classified under any particular taxonomy subject. Automatic distribution to DSMC of all documents listed in the Morris report has been requested, and requests are being processed to obtain automatic distribution of all additional documents identified in Indexes E through P of this report. The currency of the documents in the official documents section of the Library will be continually maintained through automatic DSMC receipt of revised documents as each revision is distributed by its source organization.

Planning to support operations of the official documents section in the DSMC Library revealed the need to define more clearly the following interfaces described in the May report: the interfaces between the universal subject taxonomy and the numerous environment/source taxonomies; and the interfaces between these taxonomies and the official publication indexes that were used to develop the document-source inventories and the Inventory

by Taxonomy Subject. This clearer definition indicated the need to add two Army document-source inventories, Indexes H and I, to the official documents inventory. These additions were required to assure that only current Army field manuals and technical manuals are maintained in the official documents reference section in the Library and to maintain the currency of those parts of the official documents inventory that are concerned with Army field and technical manuals.

The generally applicable "lesson learned" from this experience is that to assure the continued currency and usefulness of any special inventory of systems acquisition management documents, the following is required. Establish document-source inventories for all documents included in the special inventory--one for each set of documents that must be obtained from a particular source (e.g., Indexes E through P). Maintain the currency of each document-source inventory by using it as a control: (a) for obtaining automatic distribution of revisions or cancellations of all documents listed in it, and (b) for recording these changes, and any additions, in the document-source inventory as they occur. Use all document-source inventories in a special inventory to maintain the currency of its inventory by taxonomy subject. The key to maintaining the usefulness of any special inventory is immediate update of every one of its document-source inventories as changes or additions are received.

In early August, Lieutenant Colonel Anthony Stremic, USMC, a graduate of PMC 77-1, accomplished the following to increase the scope of the official documents inventory in this report (and of the official documents section in the library) to encompass all four military services. He arranged for automatic distribution of two Marine Corps official publications indexes to DSMC; helped develop two Marine Corps document-source inventories (Indexes L and M) and determine the subject classification of the Marine Corps documents included in the Inventory by Taxonomy Subject (Index D); and arranged for automatic distribution to DSMC of all documents (and future revisions) that were included in Indexes L and M so that the currency of the Marine Corps part of the total inventory can be maintained.

Constructive feedback from readers of the May report identified a need to define more explicitly the concept of environment taxonomies, illustrated in Figure 1. The need to clarify the interfaces between environment and subject taxonomies from a coding standpoint, was also identified. In addition, the feedback identified the need for a better subject taxonomy provision for classifying certain types of documents in the Inventory by Taxonomy Subject (Index D). The types include those major policy and organization documents that are not specifically concerned with acquisition management, but which may have significant impact on the overall process of acquisition management. Figure 2.1 was modified as shown in the present report and the Major Policies box was added to Figure 2.0 as an approach for coping with this classification and coding problem.

The results cited above have required some changes in the structure of the report which Major Tateyama submitted in May. Concept clarification and more explicit definition of the interfaces have required the use of

some different terminology, and in a few cases, the writing of completely new paragraphs of the report narrative. However, except for the new contribution by Lieutenant Colonel Stremic and the lessons learned from planning to establish an official documents reference section in the DSMC Library, the additions are results from Major Tateyama's project efforts. Accordingly, I have tried to act as an editor. While reporting current project status and results, I have tried to retain the basic structure, and where possible, the original narrative of Major Tateyama's May report.

Major Tateyama's statement in his executive summary is very true, "This report is only the beginning." Feedback is needed from many users in order to continue the project: to improve the general taxonomy and make it more useful and widely applicable as the common base for developing other needed inventories of systems acquisition management knowledge; and to increase the accuracy and comprehensiveness of the official documents inventory.

Your comments, corrections and suggestions for making both the taxonomy and the inventory more useful are requested. If you suggest additions to the inventory, please identify the official publications index which lists each suggested document. If a document is not listed in one of the 12 publications indexes used to develop the present inventory (see page C-24), please provide a copy of the index which does list the document, or provide sufficient information for DSMC to request automatic distribution of the index, so that the required new document-source inventory can be developed and maintained.

Please key your suggestions or corrections to a specific page of the report, and line number or code. An addressed postpaid comments sheet is included for your convenience at the back of the report. Marked copies of the taxonomy or inventory pages may also be used. Address your suggestions and comments to:

## EXECUTIVE SUMMARY

This report is the result of a pilot project to develop a general classification system for defense systems acquisition management in one taxonomy that will be useful for many different purposes. The initial taxonomy in Figures 2.0 through 2.13 is an integration of inputs from many members of the acquisition management community. Several possible uses of a more fully developed classification structure are identified in Section B.

A taxonomy of the Defense systems acquisition management environment was also developed to enable identification of sources of official documents. Both taxonomies and eight\* official publications indexes were used to develop an inventory of official DOD publications in order to aid the development of a practical systems acquisition management taxonomy, to test its scope and organization for one application, and to provide some immediately useful information for acquisition managers.

A subject index, Section D, was developed from the general taxonomy. It shows which official DOD, Army, Navy and Air Force documents pertain to each subject. The last part of the report gives a source listing of all official documents that were identified during the project as pertaining to defense systems acquisition management.

This report is only a beginning. All who use it are requested to feed back suggestions for improving the general taxonomy and increasing the accuracy and comprehensiveness of the official document inventory. Send your suggestions, including marked copies of the taxonomies and inventory lists to:

Defense Systems Management College  
ATTN: Dr. Mosier  
Bldg 202  
Fort Belvoir, Virginia 22060

\*Four more indexes were added in the September 1977 update of the report

SECTION A  
INTRODUCTION

Purposes

The primary purpose of this project was to continue the development of a universally applicable taxonomy for classifying the most important elements of defense systems acquisition management concepts, knowledge and practice.

Every professional group needs such a taxinomical framework for classifying and organizing its body of professional knowledge. It needs its own framework to assure that its body of knowledge is structured in the way that best supports the initial education and the continuing professional development of its members in all aspects that are critical for effective performance. It needs its own framework to help identify weak areas in its body of knowledge that need to be strengthened. It needs its own framework to facilitate communications among its members concerning inter-related and interdependent professional responsibilities, duties and job tasks. Each profession also needs its own framework to organize and store constituent items of its body of documented professional knowledge so that each member can quickly determine if particular information that he needs is available, and where among many different potential sources it is located.

This is especially true for those professionals who are responsible for managing or directly supporting defense system acquisition programs and projects. These acquisition management professionals require integrated knowledge from many academic disciplines, functional activities and job specialties. Each needs the integrated knowledge to perform

well as a member of the total management team that is required to develop, procure, test and deploy complex, but supportable, defense systems in today's dynamic national and world environment. Each manager needs this knowledge to function as an effective team member regardless of whether he is a manager in a program office, or in an activity which provides essential specialized support for the particular program or project as well as for other programs and projects.

The Taxonomy of Defense Systems Acquisition Management, Figures 2.0 through 2.13, is the product of project efforts to realize this purpose. This general classification structure is oriented toward the identification, storage, retrieval, and most important, the use of management knowledge in various acquisition situations throughout the life cycle of any complex defense system. It is hoped that this initial taxonomy will be improved through use and feedback by members of the systems acquisition management community as they try to apply it to various kinds of acquisition management information problems and situations.

The second purpose of the project was to apply the taxonomy to the development of an inventory of a subset of the body of systems acquisition management knowledge. One objective of this concurrent application during early development of the taxonomy was to obtain iterative feedback which would help make the initial taxonomy both more complete in its details and more comprehensive in its scope. Another was to provide immediately a useful product of the taxonomy's application, as well as an example of the potential of the taxonomy for organizing and inventorying other subsets of systems acquisition management knowledge. The partial inventory of official Department of Defense systems acquisition management documents, Indexes D through P in this report, is the product of project efforts toward realization of the second purpose.

### Taxonomy Coding

A major objective in support of the two purposes of this project was to develop a coding approach and structure which would facilitate the following efforts to utilize effectively all feedback received from users.

- a. Continue to improve the systems acquisition management taxonomy and make it more complete in detail and comprehensive in scope.
- b. Use the improved taxonomy to inventory additional subsets of systems acquisition management knowledge.
- c. Update all inventories periodically in order to maintain their currency and usefulness.

To enable effective accomplishment of this objective, the coding approach should meet the following conditions:

- a. Be flexible enough to permit increasing the detail and expanding the scope of the taxonomy and to facilitate its wide application for inventorying diverse subsets of systems acquisition management knowledge.
- b. Permit storing the taxonomy and all inventories on computer storage devices to enable easy update of selected items as changes occur so that the currency of the taxonomy and of each subset inventory can be economically maintained.
- c. Enable using the computer to periodically print the current inventories contained on computer storage devices, so they can be economically reproduced and distributed to users, including libraries.

### Environment Taxonomies

The need for a separate acquisition-management-information source taxonomy became evident during early attempts to use the initial acquisition-management subject taxonomy to develop the official documents inventory. This need was also reenforced by initial attempts to develop a coding structure that met the conditions stated above.

Further analysis also showed that development of a single source taxonomy, whose universality approached that of the subject taxonomy, would be impractical. Each group of potential sources for an inventory has its own

lists of items of information/knowledge which will be useful to acquisition managers. The official publications indexes published periodically by OSD and the military services, which were used in this project, are examples of these lists. The lists are available from each source. Similar lists can be grouped in a source taxonomy for use with the more universal subject taxonomy, as in this project, to develop an inventory of any particular subset of acquisition management knowledge. However, developing a new source taxonomy for each different inventory is not economical. Some rational grouping of sources is needed to reduce the number of source taxonomies whose currency must be maintained.

Collectively, the sources also provide the environment within which systems are acquired. However, the total environment encompasses so many different potential sources, each with lists, that a single environment/source taxonomy would be unmanageably large and too complex to code. A practical solution is to develop source taxonomies based on well differentiated subsets of the environment. A practical constraint is that the sources for any inventory must all be included in a single subset environment/source taxonomy. In order to distinguish between the universal defense systems acquisition management taxonomy, which classifies by subject, and those subset taxonomies which classify by source, the latter have been termed environment taxonomies.

## SECTION B

### A CONTINUING PROJECT

#### Initial Project

This project was begun by Major Tom Morris, USA, as his ISP Study Project during PMC 76-2. He began by reviewing similar prior efforts. He found that in May 1972, Mr. Al LeBlanc in OSD (DDR&E) had developed a classification tree of DOD directives in an effort to simplify the OSD directives. In June 1974, the Convair Aerospace Division, San Diego Operation, of General Dynamics had developed a matrix of Government systems documents to assist their managers in identifying, by subject, which DOD, USAF, USN, USA and NASA documents applied to systems acquisition. These studies provided Major Morris with over 100 subjects which he classified under nine major systems acquisition management headings in a single classification scheme. Next he obtained and surveyed eight of the official publications indexes listed in Section C to extract all the current documents applicable to systems acquisition management and to develop appropriate document source indexes.

Major Morris began this project because he recognized the great need for a universal taxonomy to organize and classify acquisition management information and knowledge from many diverse sources to help Defense systems acquisition management develop as a real profession. He also recognized from the beginning that the project was too big to be completed in a single ISP project. He documented his results in a "draft" report<sup>1</sup> which would provide the foundation which other PMC students could build upon and continue the project he had started.

---

<sup>1</sup> A Manager's Bibliography of Official Defense Systems Acquisition Management Documents, Charles T. Morris, Major, USA, PMC 76-2 ISP Project Report.

### Present Project

Based on the initial draft project report by Major Morris and comments from students and faculty, a single taxonomy of the systems acquisition management was attempted. It was to include the original classification tree from the initial project, as well as the sources of information. Initial attempts to use this taxonomy to develop the official documents inventory showed that a separate taxonomy was required for the sources (Figure 1) and another subject taxonomy for the "classification tree" (Figure 2.0). The subject taxonomy was further depicted in more detail for each major subject category (Figures 2.1 through 2.13). These taxonomies were distributed in draft format to the DSMC faculty for comment. Upon review and incorporation of appropriate comments, the taxonomies were finalized and used as a basis for the classification of subject categories and indexing of documents. The scope of the project was expanded largely through the following efforts:

- a. The subject categories and subcategories were increased to encompass a better grasp of the systems acquisition environment.
- b. The index coding of the sources and subject categories was accomplished to insure growth flexibility as well as acceptability for computer input. This will permit the computerized storage, update, improvement, and printouts of the document lists.
- c. The addition of AFLC documents to the inventory was performed to round out the sources at the senior acquisition headquarters level (above the commodity command/division level).
- d. An in-depth search of reference documents used in the DSMC PMC curriculum, as well as the reference document indexes of each headquarters, at least doubled the number of documents previously identified by Major Morris. Some of the added documents resulted from the expansion of the subject category taxonomy and addition of AFLC documents. The expanded listed of documents applicable to the systems acquisition management taxonomy has been used to develop the document source inventories of this report. (See Indexes E through P.)

The currency of some of the official document indexes that were available for development of the source inventories were not maintained and

need to be updated. As these source indexes are updated periodically, they should be consulted for the latest revisions to determine the currency of the documents listed in Indexes E through P.

Using both source and subject taxonomies, the Inventory by Taxonomy Subject, Index D, was developed showing which DOD, USA, USN, and USAF documents applied to each subject. Documents below the NAVMAT level (USN) are incomplete due to insufficient time for more research.

The classification of systems acquisition management knowledge shown in the subject taxonomy is arbitrary in many parts. The very nature of many subjects do not lend themselves to clearly definable classifications. Some subjects cut across all elements of systems acquisition management knowledge. However, such a taxonomy is needed and will be useful to many managers and can be improved upon as further study is made in this area.

#### Future Applications

There are many possible applications and uses of the systems acquisition management taxonomy. First, it can be expanded to further sub-classify subjects and identify acquisition management gaps, overlaps, and areas of confusion in the directives system of the Department of Defense and its components. Second, it could be used to identify unofficial studies, books, pamphlets and guides that have been published on systems acquisition management. Third, it could be used to provide an outline for an overview of systems acquisition management. For example, a short statement of the essential and important facts about each subject could be developed and published as a summary of systems acquisition management. Fourth, the taxonomy could be used as a framework for the development of a publication on lessons learned in each area. Fifth, it could be used to classify,

and catalog all acquisition management books, reports, studies and other documents in the DSMC library. Sixth, it could be used to develop a better classification for systems acquisition management information in the Defense Logistics Studies Information Exchange (DLSIE). Seventh, it could be used by the DSMC and other acquisition management schools to assist in their curriculum and course development.

#### Comments and Corrections

Time available for the project did not permit identification of every document in the official indexes that should be included in the official document inventory, nor verification of the classification of every document that was included. User feedback is encouraged as an essential part of the plan to make both the taxonomy and inventory more useful to all members of the defense systems acquisition management community.

Readers of this report are encouraged to submit suggestions and comments on the taxonomy, and corrections or additions to Indexes E through P to Dr. Andrew Mosier, Defense Systems Management College, Fort Belvoir, Virginia 22060. Please key comments to a specific page and line number or code. Marked copies of pages may also be used.

SECTION C  
TAXONOMY OF DEFENSE SYSTEMS ACQUISITION MANAGEMENT  
AND AN APPLICATION

The purpose of this taxonomy is to present a composite view of the functional areas/disciplines and organizational levels which have an impact on defense systems acquisition management. The taxonomy will be useful as a basis for a reference index of relevant documents in terms of organizational sources and acquisition management subject areas. The desired end product of this study is a current reference guide to applicable source documents to be used by systems acquisition management personnel.

The principles of classification (taxonomy) used in organizing the various elements of defense system acquisition management are based on practical usage (reference indexing), the DSMC curriculum, and organizational levels (sources) of related documents. The anticipated usage of this taxonomy is primarily as a handy reference index which will enable immediate identification of those documents required for a particular problem or area of operation. It is used in this study to begin an inventory of official DOD systems acquisition management documents. The taxonomy has been structured to approximate the functional disciplines in the DSMC curriculum in hopes that it will be used later to catalog and index other acquisition management documents, studies, reports, etc., in the DSMC library. The official systems acquisition management documents are published at the different organizational levels, and the taxonomy is designed to take maximum advantage of this fact.

As explained in the introduction, application of the subject taxonomy to the development of any inventory of systems acquisition management

SYSTEMS ACQUISITION MANAGEMENT ENVIRONMENT

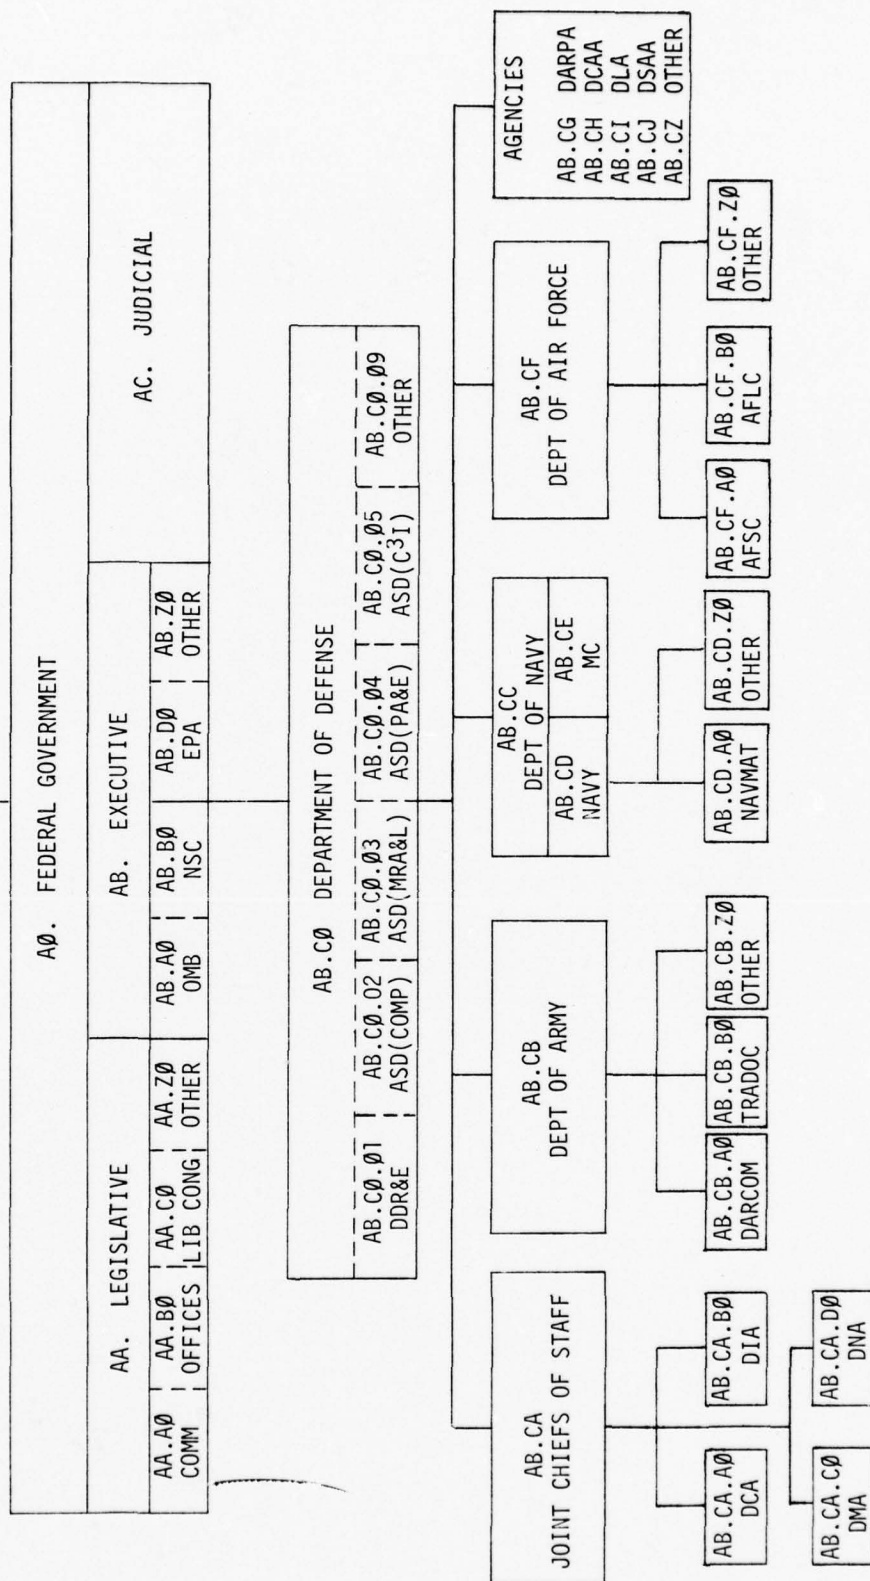

FIGURE 1. TAXONOMY OF DEFENSE SYSTEMS ACQUISITION MANAGEMENT ENVIRONMENT

knowledge requires another taxonomy of the sources information. Grouping related sources into coded taxonomies of different systems acquisition management "environments" was selected as the most economic solution on the continuum between two extremes--developing a separate taxonomy for those sources used in each inventory, or trying to develop an all-encompassing taxonomy that included all potential sources of systems acquisition management knowledge. The result is the taxonomy structure shown in Figures 1 and 2. Both type structures--the relevant environment information-source taxonomy as well as the universal subject taxonomy--are required to develop any inventory of documented systems acquisition management concepts and practice.

#### Taxonomy of the Environment

Figure 1, Taxonomy of the Defense Systems Acquisition Management Environment, includes the Federal Government sources of the twelve official publications indexes that were used to develop the official documents inventory presented in this report. The total system concept was used in the development of Figure 1. The Federal Government is a subsystem of the overall environment of defense systems acquisition management. All sources in the Federal Government subset of the total acquisition management environment carry the initial index letter A. The rest of the environment is shown at the top in dashed lines. It can be divided into other environment subset taxonomies, coded B, C, D, etc., as additional environment/source taxonomies are required in order to develop other subset inventories of acquisition management knowledge.

At the highest Federal Government level, the Legislative, Executive, and Judicial branches are the logical subclassifications and are assigned the major reference indexing letters of AA, AB, AC respectively. The

Department of Defense, assigned index letters AB.CØ, is the primary channel for higher level policy and includes the major sources of official systems acquisition management information, guidance and directives. The likely sources at the top level in DOD are the Secretary and Deputy Secretary; the Director of Defense Research and Engineering (DDR&E); Assistant Secretary of Defense, Comptroller (COMP); ASD, Manpower, Reserve Affairs, and Logistics (MRA&L); ASD, Planning, Analysis, and Evaluation (PA&E); and the ASD, Communications, Command, Control, and Intelligence (C<sup>3</sup>I). A further breakdown of DOD substructure is illustrated in Figure 1 and reflects the taxonomy by sources of documents.

In addition to its use in development of the official documents inventory presented in this report, Figure 1 can also be used to develop and help code other inventories for which the Federal Government is the source of information. It can also be easily expanded to include other Federal Government sources--such as the General Accounting Office (GAO) in the Legislative Branch, or the Occupational Safety and Health Administration (OSHA) in the Executive Branch--when lists of documents from these sources are needed for use with the universal subject taxonomy to develop other subset inventories. Furthermore, the coding approach and structure shown on the environment and subject taxonomies (Figures 1 and Figures 2.0 through 2.13) appear adequate to meet all anticipated uses of other environment taxonomies that might need to be developed for use with the universal subject taxonomy to prepare other inventories of systems acquisition management knowledge.

## Taxonomy of Systems Acquisition Management

In taxonomy classification by subject, the overall field of systems acquisition management is the prime area of interest and is referenced by index 10 as shown in Figure 2.0. Major policy directives and other major policy guidance on general or overall system acquisition management practices, such as DOD Directives 5000.1 and 5000.2, will be listed under the major policies level of the taxonomy. Similarly, documents with indirect but significant impact on system acquisition management, such as organizational policies and responsibilities of DOD offices, are also listed at the major policies level.

The various functions and disciplines under the general field of systems acquisition management are listed below the 10.00 level and subdivided with index numbers 10.01 through 10.12 (see Figure 2.0). Subclassifications for each major numerical index will follow the scheme indicated by Figures 2.1 through 2.13.

The subdisciplines of systems acquisition management are arranged in the approximate order of their occurrence during the life cycle. Therefore, beginning with a determination of the systems requirements (level 10.01), program initiation is pursued. Requirements may be prompted from advances in the technology base (level 10.01.01) or from user/higher headquarters analyses of future threats (level 10.01.02). The culmination, if appropriate, of the requirements determination process is a Mission Element Needs Statement (MENS) which is a proposal for approval of a system program (level 10.01.03).

Approval of the MENS would signal the need for program/project management (level 10.02) efforts. Considered from a comprehensive viewpoint, program/project management includes all the subdisciplines/functions that

follow, 10.03 through 10.12. To simplify this taxonomy, however, this classification is restricted to those subjects/activities, which at operating levels, are truly general to all aspects of program/project management; and to those subjects/activities that are operationally specific, but which involve or cut across the boundaries of two or more of the subdisciplines/functions 10.03 through 10.12.

Program/project management is applicable to the acquisition of all types of systems but not always in the same way. Different types of systems (level 10.02.03) will require organization and management that is significantly different in some aspects and that is tailored to the major characteristics of the particular class of systems. Although the boundaries are not precise, six different types of systems have been identified in this initial effort to classify systems for more tailored program management.

a. Normal or typical systems (level 10.02.03.01) are those systems, such as airplanes, missiles and tanks, that are complex enough to require a great deal of engineering development and test, followed by production and deployment of a large quantity of the developed system. The phases of the acquisition life cycle inherent for these systems correspond closely to the milestone decision points described in DODD 5000.1.

b. Lead-follow systems (level 10.02.03.02) are large, costly, long lived, few or one of a kind systems. Naval ships and large early warning radar facilities are examples. The engineering development and production phases overlap for the leader (first) system. Experience, drawings, etc., gained from building the leader are then used to build any follower systems. Major modification programs, dealing with major subsystems, are used throughout the long life of the large original systems to maintain their operational effectiveness in a changing environment.

c. Standard Module Subsystems (level 10.02.03.03) are "building blocks" to be used as essential subsystems of similar major systems. Examples include warheads, guidance packages and propulsion subsystems which must meet form, fit and function interface requirements of more than one type of RPV, missile or aircraft systems.

d. Common technology systems (level 10.02.03.04) are groups of small systems whose acquisition, because they require the same technical expertise and management process, are managed by one management office, e.g., a "basket SPO". The life and organization of the program management office (PMO) is not tied to a system's acquisition cycle. Each system may be in a different phase of its acquisition cycle. The systems "flow through" the PMO whose organization tends to be constant as long as the technology itself and the requirement for it do not change. The systems may or may not be subsystems of other larger types of systems identified in level 10.02.03.

e. Additions to large permanent systems (level 10.02.03.05) are advanced systems which do not replace existing large systems. Instead, they are interoperable additions to one or more large permanent systems such as WWMCS or long line communications systems. Another example is SINGGARS (Single Channel Ground and Airborne Radio Subsystem).

f. Major software systems (level 10.02.03.06) are embedded computer systems or computer program oriented management applications to such areas as supply or other logistic systems.

One of the most important attributes of a successful program office is effective organizational behavior interactions (level 10.03). The structuring of the program management office should be considered in relation to the other interpersonal activities which can be described by 10.03 sub-levels. The establishment of a sound organizational base can be a key to the successful launch of a system program office.

The application of the decision/statistical analysis methods (level 10.04), systems engineering management (level 10.05), financial management (level 10.06), procurement management (level 10.07), and test and evaluation considerations (level 10.08) are instrumental in the entire acquisition life cycle of a system. Culminating in production (level 10.09) and initial deployment (level 10.10) of the system to the field, the system eventually becomes a viable part of our national defense weaponry.

During the normal deployment phase of the life cycle, the system may require modernization, modification, or other improvement efforts (level 10.11) to insure its capability to meet the everchanging threats and technological advances. Also during the deployment phase, operations information feedback (level 10.12) provides operational data which will be useful in the determination of requirements for new systems. Additionally, it provides operational cost, maintenance, reliability, availability, and other similar data which enable development of improved systems in the future.

### Initial Application to Develop an Official Documents Inventory

The subject and environment/source taxonomies were used together with 12 official publications indexes to develop an inventory of official defense systems acquisition management documents. The inventory is comprehensive in design. It contains official directives, regulations, instructions, orders, guides and other documents that are published by the Department of Defense, the four major military service components, the four major logistics commands in the DOD, plus a few instructions published by the systems commands of the Navy Material Command. The scope of the inventory can be expanded to include all of the subordinate commodity commands and divisions of the other major logistic commands, as well as the DOD agencies shown on Figure 1, by adding their official publications indexes to the 12 used in the present inventory.

The present inventory, consisting of an inventory by acquisition management subject and 12 document source inventories, comprises the rest of the report. The Inventory by Taxonomy Subject, Index D, classifies by taxonomy category all official documents that were identified during the inventory part of the project as pertaining to, or significantly impacting, the management of defense system acquisitions. Index D also identifies the organizational source and document number of each document included in the inventory. Indexes E through P are the document source inventories. Together they list all of the DOD documents classified by subject in Index D. Each source inventory was developed from the official publications index that is published periodically by the organizational source of the documents listed in the index.

The 12 official publications indexes that were used are listed below, each preceded by the index letter of the source inventory that was developed

from the official index. The Marine Corps inventory indexes L and M were developed by a PMC 77-1 graduate, Lieutenant Colonel Anthony Stremic, USMC, in August 1977 after the initial project report was submitted. (See explanation in the Preface.)

<u>INVENTORY INDEX</u>	<u>OFFICIAL PUBLICATIONS INDEX DATE &amp; TITLE</u>	
E	31 Mar 77	DOD Directives System, Quarterly Index of DOD Issuances
F	1 Jul 75	DOD Index of Specifications and Standards, Part II, Numerical Listing
G	1 May 75 Aug 75 C1	Department of the Army Pamphlet 310-1, Index of Administrative Publications (Regulations, Pamphlets and Circulars)
H	30 May 75	Department of the Army Pamphlet 310-3, Index of Doctrinal, Training and Organizational Publications (Field Manuals, etc.)
I	29 Nov 74 14 Feb 75 C1	Department of the Army Pamphlet 310-4, Index of Technical Manuals, etc.
J	3 Mar 75	Headquarters, US Army Materiel Command, AMC Pam 310-1, Index of Publications and Blank Forms
K	2 Jan 77	Department of the Navy Directives Issuance System, NAVPUBNOTE 5215, Consolidated Subject Index of Instructions
L	2 May 77	Headquarters, US Marine Corps, MC Bul 5215, Marine Corps Directives System Quarterly Checklist
M	1 Jul 77	Headquarters, US Marine Corps, HQ Bul 5215, Semiannual Checklist of Headquarters Orders
N	4 Mar 77	Headquarters, US Air Force, AF Regulation 0-2, Numerical and Subjective Index of Standard Publications
O	1 Apr 77	Headquarters, Air Force Systems Command, AFSC Regulation 0-2, Numerical Index of AFSC Publications
P	31 Oct 76	Headquarters, Air Force Logistics Command, AFLC Regulation 0-2, Numerical Index of AFLC Publications

#### Uses of Official Documents Inventory

To identify and locate documents that pertain to a particular subject, first use the Inventory by Taxonomy Subject, Index D, to identify the organizational sources and document numbers of all documents that pertain to the subject of interest. Then locate each document number in the appropriate document source inventory, Index E through P, to get additional information about the document (e.g., title, date, kind of document, and the official source of the document) so that it may be obtained for review.

To determine the particular subject(s) under which a document is classified in Index D, first use the appropriate document source inventory to determine the taxonomy category number(s) of the document. Then use the category number(s) to find the taxonomy subject(s) in Index D under which the document has been classified. This reverse process is used primarily to assure that revisions or cancellations of documents listed in the source inventories are reflected in Index D in order to keep current the Inventory by Taxonomy Subject.
